

Allied Installs TIGER Model S-6

In 2016, Allied Concrete, out of Richmond Virginia approached Pathfinder to replace an aging machine in their block production facility. Allied's main concerns, when looking for a replacement were:

1. Speed of Operation
2. Consistency of Quality Masonry Products
3. Low Cost of Operation

Allied ultimately decided on a TIGER Model S-6 machine from Pathfinder Systems.

The S-6 machine is designed to be a direct replacement for the existing machinery operating today. In Allied's case, the S-6 fit on their existing foundation; utilizing their current mold inventory and could bolt directly to existing conveyors; as well as other equipment in their facility. This direct replacement approach allowed Pathfinder to implement an aggressive installation schedule while reducing the upfront cost of the purchase. Allied was able to utilize existing molds, eliminate costly demolition, and reconfiguration of current foundations.

Once the installation was complete, Allied could fine tune the machine to optimize their production speeds. Throughout the process, Pathfinder and TIGER technicians were onsite to assist and train Allied's personnel on machine adjustments and configurations.

The S-6 is already setting new standards for masonry unit outputs, as well as product quality. The ease of use, and intuitive controls allows for a very fast learning curve and exceptional control of their manufacturing processes.

Allied has now been running the Model S for about 3 months. They are very happy with their decision to upgrade their machinery. The fast cycle times, proven quality, and ease of use is already setting a new standards in block manufacturing; ultimately providing a quick return on their investment.
